

Pallet Stretch Wrap

Stretch wrap is most commonly made of LLDPE or linear low density polyethylene. It is the material that secures the pallets of individual containers. All pallets together forms high quality pallet stretch wrap film. Pallet stretch wrap is used by almost all manufacturers and distributors to bind shipping cartons to pallets going to a distribution center or a warehouse. It is also used at the distribution center to wrap pallets sent to customers or outlets.

Features and benefits

Pallet stretch wrap can be applied automatically with semi or fully automatic wrapping machines or by hand, with hand grade or bundling tape. Bundling tape binds together products leaving together any residues one normally experiences with adhesive tape. It is easy to remove and don't damage the product.

It offers maximum cling, and strength. This film has extremely high puncture resistance and a very high holding force and is ideal for the most demanding applications. Product manufacturers and distributors use pallet stretch wrappers to bind shipping cartons to pallets. It is also used to wrap pallets sent to outlets or customers.

Pallet Stretch Wrap and Packaging

It offers semi-automatic operation. It wraps loads while the driver remains on the forklift for all operations, providing faster and more ergonomically sound packaging or shipping operations. This adds to the overall confidence of more secured loads along the way. It works with all types of equipment. It may be used with both rider forklift and stand up, narrow aisle lifts.
